

**A 'One Wire' Weather Station  
by Barry Smith 15th September 2008**

My weather station contains instruments for measuring pressure, temperature, humidity, rainfall, wind speed and wind direction. The weather data is uploaded to a website every 15 minutes.

The typical British citizen is likely to say something about the weather every day.

How would you like to have facts and figures for your own location?

How much rain did we have last month?

How hot was it yesterday?

Computerised weather stations are now quite affordable and there is a wide choice available. Some systems allow you to share your results by publishing the readings on the internet.

I have recently installed such a system.

You can see some details of it on my website at:

<http://www.g4iat.co.uk/1wire/intro.html>

The information is "work in progress" and may be added to at any time. If there are specific questions you have then you can contact me at:
